CDriveBack Get a CD mailed to you: CDriveBack from On-Disk.com .

CDriveBack is a backup system.

CDriveBack's design goal is to make a backup system so easy to use that the end users with no backup, eighty percent of XP Home users and thirty percent of home XP Professional users, take backups and can easily restore their system.

For example, backing up the C: drive to an area on the C: drive takes two steps:

- Boot the CDriveBack CD, when the first screen shows,
- Hit enter to backup the C: drive.

CDriveBack is:

- A Live CD, one that you can boot, requiring no installs, using,
 - Linux 2.6.x, a recent version of the Linux operating system, to run
 - Dialog screens that manage backup files on your drives and
 - Use DAR to backup the partition or drive to files, in turn using, when needed,
 - Backing up older Windows drives as well as Linux formatted drives is built-in
 - NTFS-3G, the NTFS Drive handling package. is used for NTFS drives. On-disk.com has kindly arranged to ship you a CD, if you prefer. CDriveBack at On-Disk . To CDriveBack @ Source Forge
